Git & GitHUB

Git is a version control system .

Think of Git as a notebook that records the important stages of your project.
Git helps you track changes in your project and keeps a record of different versions of your code.

What is GitHub ?

GitHub is an online platform where you can store and manage Git repositories.
GitHub lets you upload that project to the internet so you can access it online, share it, and collaborate with others.

Git Commands :

Setup the git so that it can know who is going to make the commits .

1. **Git - -version**
2. **Git config –global user.name "mehrooq"**
3. **Git config –global user.email mehrooq@gmail.com**

To Display The Details Of The User.

1. **Git config –list**
2. **Clear – to clear the git window**
3. **To return the current prompt at $ … use ctrl + c**
4. **To show the current user : pwd**
5. **To listing the directories: ls**

Creating our first "git" repository:

1. **To change the directory : cd ..**
2. **To go into some directory : cd <directory name>**
3. **To create the file the repository: touch <filename?**

Now we will track the files of our repository through "git"

1. **Git init : To initialize the git**
2. **To display the repository files : ls or ls .**
3. **To display the hidden files of your reopository: ls –a**
4. **To add the untracked files : git add filename**
5. **To add multiple untracked files : git add .**

Now create the sign up form :

1. **Git remote add origin <url>**
2. **Git remote set-url origin <url>**

Now push the files :

1. **git push -u origin main**
